

**Nandrolone phenylpropionate** - a powerful anabolic steroid that has low androgenic activity. The active ingredient of the drug - phenylpropionate nandrolone ester - not simply the modification of testosterone. Widely known other nandrolone ester - decanoate, characterized in longer duration of action, but also a higher probability of occurrence of side effects.

Properties and action NPP 100 from Aburaihan companies provide the athlete gain quality muscle mass and strength, strengthen tendons and bones, increase immunity. In addition, the drug has anti-inflammatory action and fat burning effect.

## Description Nandrolone Phenylpropionate

This modification of testosterone was developed in the 1960s, a major pharmaceutical company Organon, and is currently used for medical purposes. For example, for the treatment and prevention of degeneration, breast cancer, during recovery operations. Soon anabolic activity of the drug was appreciated by athletes.

Today, NPP 100, manufactured by different companies, has been successfully used in bodybuilding, powerlifting, and heavy athletics. First of all, it gives muscle growth, though not so quickly, but growth is a quality that does not require rework, without a strong pullback.

Side effects npp steroid occur more rarely and weaker than its terrestrial counterpart decanoate. That in itself is a shorter air so quickly dissociates in the body and has a shorter duration of action.

Detailed instructions on the use of NPP 100 on Aburayhan laid out on our forum, where you can also get answers to all your questions on steroids. The disadvantage of the preparation is very long detection period in the organism, which excludes the possibility of reception before the competition. During the one and a half years after a course of anti-doping tests may give a positive result. Therefore, it is for the development of the physical form is usually used by athletes just starting a career, or to recover from injury.

This drug is a kind of starting point, creating a good muscle and strength for the future. One of the main actions of Nandrolone Phenylpropionate (Aburaihan) - activation of protein synthesis, improving its digestibility cells and fat burning. Therefore, during its use is necessary to provide a rich protein diet. Unlike many other anabolic steroids, anti-inflammatory and this strengthens immunity action, and also enhances the production of collagen. And if you do not abuse doses of Nandrolone Phenylpropionate, you not only get the side effects, but also improve health. Drug overdose causes fluid accumulation, reverse the accumulation of fat and gynecomastia.

The cost of this anabolic steroid is pleasing in terms of price and quality. The drug rarely causes acne or increased pressure injection is not toxic to the liver. Low aromatization easily neutralized by anti-estrogens, and feature natural testosterone quickly normalized at the end of the course.

## How to take Nandrolone Phenylpropionate

Active ingredient remains for 2-3 days after injection, respectively, injections are placed usually in a day or two. Optimal this steroid for men is 50-100 mg per day of injection, or 150-300 mg per week. This gives optimum results for most athletes.

Of course, based on the characteristics of each athlete, the rate of anabolic drugs should be prepared individually, sometimes possible to increase these doses. Duration of 4-8 weeks. In view of the reduced androgens and rapid period of use of NPP 100 on Aburayhan possibly women. For them, the dosage should not exceed 50 mg every three days. Since this drug is easy to avoid virilization, adhering to reasonable dosages.

The course npp steroid is ideally combined with other steroids, and gives stunning effects in strength and mass, and as a muscle. Combining the drug with Winstrol, Masteron or Turinabol lifter body creates a synergistic effect. This means that every drug enhances the action of each other. Thus obtained is characterized by dry muscle mass and vividness. Of course, combinations of the drug dosage should be reduced slightly to prevent overdose.

The course of the anabolic steroid, like any other steroid flavoring requires receiving antiestrogens. Provide intensive training and sports diet, an athlete can achieve a significant increase in their athletic performance.
